## Learning Objectives

MedBridge

Lessons from 7-12 Month Olds to Analyze & Treat in Early Intervention

Suzanne Davis Bombria, PT, C/NDT

### Course Objectives:

- Analyze the development of the baby from 7-12 months and, based on this analysis, identify effective treatment strategies for babies working on these developmental components and skills
- Develop appropriate home program activities for families with babies of this age
- Discuss the development of the spine in the 7-12 month old and its impact on function
- Identify functional changes made in the 7-12 month old
- Identify the components of posture and movement underlying the functional changes
- Highlight the typical developmental components present in babies from 7-12 months
- Compare the development of typical babies from 7-12 months to atypically developing babies
- Identify components of treatment that need to be addressed for the atypically developing child
- Identify the component of development that is needed to improve function
- Demonstrate treatment strategies that specifically address the components present in typical baby development from 7-12 months
